

## Objective

This lab is about creating and testing a Web Application Firewall (WAF)

The WAF protects web servers by checking incoming requests and blocking dangerous ones

It helps understand how web security tools prevent common attacks.

## Implementation Summary

The WAF checks every request using regex rules

If a rule matches a known attack pattern, it blocks the request with a 403 error

If nothing matches, the request is sent to the backend normally.

## Inspected Components

- Path → Detects directory traversal or local file inclusion attacks (../, etc/passwd).
- Query Parameters → Identifies SQL injection attempts (UNION SELECT, OR 1=1, --).
- Request Body → Detects XSS or command injection payloads (<script>, ;, &&, |).

```
raghad@raghad-VMware-Virtual-Platform:~$ curl -i "http://127.0.0.1:8080/?id=1"
HTTP/1.1 200 OK
Server: Werkzeug/3.1.3 Python/3.12.3
Date: Mon, 03 Nov 2025 20:39:14 GMT
Server: SimpleHTTP/0.6 Python/3.12.3
Date: Mon, 03 Nov 2025 20:39:14 GMT
Content-type: text/html
Last-Modified: Mon, 03 Nov 2025 20:23:25 GMT
Content-Length: 3
Connection: close

OK
```

```
raghad@raghad-VMware-Virtual-Platform:~$ curl -i "http://127.0.0.1:8080/?id=1%20UNION%20SEL
CT%20%2A%20FROM%20users"
HTTP/1.1 403 FORBIDDEN
Server: Werkzeug/3.1.3 Python/3.12.3
Date: Mon, 03 Nov 2025 20:43:43 GMT
Content-Type: text/html; charset=utf-8
Content-Length: 22
Connection: close
Show Apps
Request blocked by WAFraghad@raghad-VMware-Virtual-Platform:~$
```

```
raghad@raghad-VMware-Virtual-Platform:~$ curl -i -X POST "http://127.0.0.1:8080/comment" -d
"<script>alert(1)</script>"
HTTP/1.1 403 FORBIDDEN
Server: Werkzeug/3.1.3 Python/3.12.3
Date: Mon, 03 Nov 2025 21:02:35 GMT
Content-Type: text/html; charset=utf-8
Content-Length: 22
Connection: close

Request blocked by WAFraghad@raghad-VMware-Virtual-Platform:~$
```

```
raghad@raghad-VMware-Virtual-Platform:~$ curl -i "http://127.0.0.1:8080/%2e%2e/%2e%2e/%2e%2e
/etc/passwd"
HTTP/1.1 403 FORBIDDEN
Server: Werkzeug/3.1.3 Python/3.12.3
Date: Mon, 03 Nov 2025 21:05:44 GMT

Content-Length: 22
Connection: close

Request blocked by WAFraghad@raghad-VMware-Virtual-Platform:~$
```

## Logging & Evidence

Every event (blocked or allowed) is recorded in:

- waf.log → Human-readable text logs.
- waf.jsonl → JSON lines for structured analysis.

Each log entry includes:

- Timestamp
- Client IP
- Path
- Action (allowed/blocked)
- Reason and matching rule

```
Request blocked by WAFraghad@raghad-VMware-Virtual-Platform:~$ tail -n 20 ~/waf_project/waf.log
tail -n 20 ~/waf_project/waf.log
[2025-11-03T20:43:43.800848Z] BLOCKED ip=127.0.0.1 method=GET path=/ reason=pattern-match payload=1 UNION SELECT * FROM users
[2025-11-03T21:02:35.393680Z] BLOCKED ip=127.0.0.1 method=POST path=/comment reason=pattern-match payload=comment <script>alert(1)</script>
[2025-11-03T21:05:44.452172Z] BLOCKED ip=127.0.0.1 method=GET path=/../../../../etc/passwd reason=pattern-match payload=../../../../etc/passwd
[2025-11-03T21:08:38.783900Z] BLOCKED ip=127.0.0.1 method=GET path=/ reason=pattern-match payload=who; cat /etc/passwd
raghad@raghad-VMware-Virtual-Platform:~$
```

## Conclusion

The WAF effectively detects and blocks common attacks using regex-based rules while logging detailed events. It provides a simple yet practical layer of protection for web applications
